With the latest versions of acoustica mixcraft pro, you will be able to experience the world of music in a whole new way. You will be able to What is Acoustica.mix? Acoustica.mix is an audio recording app and a music editing program for producing and remixing tracks in MP3, FLAC, and OGG formats. It features a feature-rich yet easy-to-use interface, an audio sequencer, a trackQ: How to dynamically initialize a mysql connection in C# I have a.NET application that requires to load data into a mysql database from different sources (csv, xml, txt, etc) I created this app and I must say it works pretty well with all these different sources, but I also need to be able to load data from a url as a last option. For that I need to load the data from a mysql database, for which I used the MySqlDataReader class. I'm currently using the connection from MySql.Data like this: MySqlConnection c = new MySqlConnection(); c.ConnectionString = ConfigurationManager.ConnectionStrings["mysql"].ConnectionString; MySqlCommand cCommand = new MySqlCommand(); cCommand.Connection = c; But this connection is always required, and I guess this is something I can't avoid for the final version of my app. Is there anyway I can "dynamically" connect to the mysql database and load the data? A: Could you use a named connection for that? MySqlConnection myConn = new MySqlConnection("server=localhost;database=db;uid=user;pwd=pass;charset=utf8"); myConn.Open(); MySqlCommand cmd = new MySqlCommand("SELECT \* FROM table", myConn); In this way you can use the connection name like above: MySqlConnection myConn = new MySqlConnection("server=localhost;database=db;uid=user;pwd=pass;charset=utf8"); Or the connection name that's in your configuration file, etc. You can also use a property like connection string. I think you should be able to set it dynamically. private string \_connectionString; public string 82157476af
